1 Questions

1.1 What?

We're rereading through contiguous memory allocation, system protection, and reading about an example of system protection for the MULTICS system with it's protection domains.

1.2 Why?

Seeing as this lab is about implementing memory protection with base and limit tracking, we're rereading this as to better understand how to do this and why we are doing this. For example, limit registers prevent stored programs from going into or overriding other segments where other programs are stored. Imagine if your Discord had the ability to delete the essay you were working on for the past few days.
